Code Walkthrough Conventions

CodeFixPanda_Kotlin · senior Android interview preparation · version 2, 2026-11-11

These rules govern how Claude walks through the code with me. To reuse them in a new session, ask Claude to read this file before starting.

1. Follow the execution order

Start at `MainActivity`, which launches the app, and step through the code in the order it runs. The goal is to understand the low-level details across the whole implementation.

2. Work in small chunks

- Open a file and identify the main function or method that starts things off.
- Each step covers 3 to 8 lines of code.
- If a step needs more than 8 lines, say so at the start of the message.

3. Link to the source file

Every step includes a link to the file and line being discussed, so that I can open and view it inside the web session without leaving it.

4. Code snippet and link go last

- The explanation comes first.
- The code snippet, together with its file link, is the last part of the content.
- I use the snippet as the reference point and scroll up for the details.

5. Status footer on every message

The very last line of every message shows where we are, below the code snippet:

```
Branch: <current git branch> · Commit: <short hash> · Conventions: v2
```

The branch and commit come from the repository as it is when the message is sent, not from memory. Sandbox work uses the layout in the sandbox report: a feature-set branch that is never merged, and one step branch per step, named `sandbox/walkthrough-step-NN-topic`.

Shape of each step

```
Chunk N: <what this step covers> (<line count>)

<explanation of each line>
<points an interviewer might probe>
<what comes next>

<link to file:line>
<code snippet>

Branch: <branch> · Commit: <hash> · Conventions: v2
```
